DXCC_XML_LIST.exe serves the following tasks

1. Calculation based on data obtain from page CLUBLOG parameters, ie
No ADIF, CQ_Zone, ITU_Zone for the QSO. When calculating is taken also the
date of QSO, because this QSOs may be from the past. Sou may do different results.
Files for DXCC lists stored on servers CLUBLOG contain data starting since 1945 year
Examples of results you see when you click on this link
http://sp9auv.com/Pliki/dxcc_xml_bookmak_en_1_3_xml.jpg
2. Load ADIF file from logger to the the website CLUBLOG and then
after processing there (calculation of normal value NR-ADIF
and CQ_ZONE according to rules applied on pages CLUBLOG). It is important that
that the correct results are also obtained for QSO's from the past.) , and next
download the results as a ADIF file and show the differences on the screen.
Translated file ADIF can then be used as a new file for import to logger
Examples of results you see when you click on this link

3. Create a universal DXCC List as a dll module - DXCC_lst.dll. Dll module can be
used by all programmers amateur programs in their application programs in
any programming language (Delphi, C ++, Visual Basic, Microsoft Visual C ++).
This frees the programmers from the need to watch changes for DXCC list -
because for him doing this dll module

You can download this program from
